- used to Nucleic acid encoding hypersensitive response-eliciting protein - used improve growth of plants and impart resistance to disease and insects.

Claim 18; Page 57-58; 75pp; English.

protein DSPF of Erwinia amylovora. The nucleotide sequence of the dsp region of E. amylovora strain E3321 was determined using subclones of DCP430. A two-gene opernon was discovered comprising dspE (see AAX24810) and dspF (see AAX24811). The isolated dsp DNA molecules and encoded proteins can be used to impart disease resistance to plants, to enhance plant growth, and/or to control insects on plants. This is achieved by applying a hypersensitive response elicitor protein or polypeptide in non-infectious form to plants or plant seeds, or by producing transgenic plants or plant seeds transformed with DNA encoding a hypersensitive response elicitor. Protection can be provided against a wide range of viruses, bacteria, fungi and insects, e.g. tobacco mosaic virus and tomato mosaic virus, Pseudomonas syringae, Xanthomonas campestris, This polypeptide comprises the 16 kDa hypersensitive response elicitor

Application of a hypersensitive response elicitor protein to plants to impart stress resistance.

Disclosure; Page 21; 84pp; English.

The patent discloses a method to impart stress resistance to plants by applying a hypersensitive response elicitor in a non-infectious form to a plant or seed. The present sequence is a hypersensitive response elicitor encoded by dspF gene from Erwinia amylovora. The protein is used to impart stress resistance to plants

Sequence 139 AA;

```
The present sequence represents a hypersensitive response elicitor polypeptide. The polynucleotide represents the dspF gene. The polynucleotide represents the dspF gene. The polynucleotide represents the dspF gene. The polypeptide fragments, which do not elicit a hypersensitive response. Instead, the proteins impart disease resistance to plants, enhance plant growth, and/or control insects. The plants which may be treated in this way include vegetables, crops and ornamental plants such as alfalfa, rice, wheat, vegetables, crops and ornamental plants such as alfalfa, rice, wheat, barley, rye, cotton, sunflower, peanut, corn, potato, sweet potato, bean, pea, chicory, lettuce, endive, cabage, brussel sprout, beet, parship, turnip, cauliflower, broccoli, radieh, spinach, onion, garlic, eggplant, pepper, carror, squash, pumpkin, zucchini, cucumber, apple, pear, melon, citrus, strawberry, grape, raspberry, pineapple, soybean, tobacco, comato, sorghum or sugarcane, Arabidopsis thaliana, Saintpaulia, petunia, pelargonium, poinsettia, chrysanthemum, carnation or zinnia

The patent discloses hypersensitive response elicitor proteins and nucleotides encoding such proteins. Hypersensitive response elicitor for nucleotides encoding such proteins. Hypersensitive response elicitor comprise an isolated pair or more of spaced apart domains, each comprising an acidic portion linked to an alpha-helix and capable of eliciting a hypersensitive response in plants. Sequences of the invention care used to impart disease resistance to plants, to enhance plant growth, to control insects and/or to impart stress resistance to plants which includes resistance to environmental stress such as climate, air complution, chemical and nutritional stress. The method of imparting disease resistance has the potential for treating previously untreatable disease, treating diseases systemically and avoiding the use of infectious agents or environmentally harmful materials. Hyper. sensitive response elicitor sequences are used to enhance plant growth which encompasses greater yield, increased in quantity of seeds produced, percentage of seeds germinated, plant size and biomass, bigger fruits, earlier fruit coloration and plant maturation. They are also used for insect control which encompasses preventing direct insect damage to plant insect control which encompasses preventing direct insect damage to plant by feeding injury, interfering with insect larval feeding on the plants,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New hypersensitive response elicitor proteins comprising spaced apart domains having an acidic portion linked to an alpha-helix, useful for imparting disease or stress resistance, controlling insects or enhancing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Page 24; 99pp; English.

                                                                                                                                                                                                                                                                                                                          27-DEC-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fan H,
```

The sequence represents an Erwinia amylovora disease-specific region F (dspF) polypeptide, a chaperone of dspE, which elicits a hypersensitive response in plants. The dspE operon functions as an avirulence (avr) locus and the dspE protein is required for pathogenicity of Erwinia amylovora. DspE is also responsible for causing fireblight in certain plants. The protein and its associated mucleic acid can be applied in a non-infectious form to plants or plant seeds to impart disease resistance, to enhance plant growth, and/or to control insects on plants. Alternatively, plant cells may be transformed with the DNA to form transgenic plants with the same properties. The method can be utilised to treat a wide variety of plants and seeds, including crop plants such as rice, wheat, corn, cabbage, cauliflower, garlic, cucumber, apple, grape, the plants of the plants such as Arabidopsis

thaliana, petunia, chrysanthemum and carnation

preventing insects from colonising host plants and releasing phytotoxins. Sequences of the invention also prevent subsequent disease damage to plants resulting from insect infection. The present sequence is Erwinia amylovora hypersensitive response elicitor protein, dspf
                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular

proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for that has an activity against a biological pathway required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an corganism acts, (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. auxeus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                84 RGCWLALD---ELHN-----VRLCFQQSLE------HLDBASFSDIVSGFIEHAAEV 126

the foll antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular confideration or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway to proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway or proliferation, or that inhibits cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibioing strains in which the gene compound; a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying the carget of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying the carget of a compound that inhibits the proliferation of an organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8
                                                                                                                                                                                New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  K. pneumoniae or P. aeruginosa. This represents a delta9 14:0-ACP desaturase. The 14:0-ACP desaturase and 22:1 omega 5 and 24:1 omega 5 anacardic acids. The gene can be used to provide pest resistance in plants. The gene can be used to provide pest resistance in plants. The gene can also be used to provide pest resistance in plants. The gene can also be used to soybeans, rapeseed, maize, sunflower, safflower, octton, cupha, peanut, coconut, oil-palm and pelargonium. The gene and its expression products can also be used in manufacturing methods, e.g. in innovative processes for making specialty polymers such as nylon and other methods in which unsaturated fatty acids are used as constituents or starting materials. In addition the promoter from the gene can be used for trichome specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated 14:0-ACP desaturase gene - obtained from geranium plants, used to enhance pest resistance of plants and for enhancing production of unsaturated fatty acids in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                169 ROVEKTIÓYLIALGODIGTEKNPYHL-----FIYTSFOERATFISHANTAKLAQOHGDKQ 223

                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represnets an alternatively spliced snake venom protease-1 (SVPH-1) polypeptide, designated SVPH-1a. The SVPH colypeptides are metalloproteinase-disintegrin family members. The SVPH polynucleotides can be used as probes to identify nucleic acids encoding proteins having metalloproteinase-disintegrin activity, to identify human chromosome 1 or 4, to map genes on those chromosomes, to identify human chromosome 1 or 4, to map genes on those chromosomes, to identify pumes associated with diseases, syndromes and conditions associated with the chromosomes, and to study proteinases and their activities on cell/cell interactions and the immune system. Sense or artisense oligonucleotides of SVPH and the immune system. Sense or can cell/matrix interactions involved in cellular processes and in the immune system. The polypeptides may also be used to screen for inhibitors of the polypeptide's activity, which are used in therapeutics. The antibodies can be used in assays to detect the presence of the antibodies can be used in assays to detect the presence of the polypeptides in vitro or in vivo, and to purify the polypeptides by

antisense oligonoclectides of SVPH can be used to inhibit gene expression of SVPH 1, 3, or 4. The SVPH polypeptides can be used to study cell/cell and cell/matrix interactions involved in cellular processes and in the immune system. The polypeptides may also be used to screen for inhibitors of the polypeptide's activity, which are used in therapeutics. The antibodies can be used in assays to detect the presence of the polypeptides in vitro or in vilvo, and to purify the polypeptides by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    60 GQKHIHIKVKKLLFSKHLPVFTYTDQGAILEDQPFVQNNCYYH-GYVEGDPESLVSLST 118

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents an alternatively spliced snake venom protease-1 (SVPH-1) polypeptide, designated SVPH-1b. The SVPH polypeptides are metalloproteinase-disintegrin protein family members. The SVPH polypucleotides can be used as probes to identify nucleic acids encoding proteins having metalloproteinase-disintegrin activity, to identify human chromosome 1 or 4, to map genes on those chromosomes, to identify genes associated with diseases, syndromes and conditions associated with the chromosomes, and to study proteinases and their activities on cell/cell interactions and the immune system. Sense or

the sample with a reagent and detecting the intensity of this interaction. Accordingly, via gene therapy, these ESNAs are useful for preparing a cytostatic composition for diagnosing or treating endometrial cancer. This polypeptide sequence is a human endometrial specific polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    67 ITLYSMILQLNFEMAAMRGCWLALDELHN-VRLCFQQSLEHLDEASFSDIVSGFIEHAAE 125
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                proteins thereof, which are present in normal and neoplastic endometrial cells. Specifically, it refers to the use of these endometrial specific nucleic acids (ESNAs), as well as suitable antibodies, agonists and antagonists that are useful for the identification, diagnosis and monitoring of endometrial cancer. The present invention describes a method for monitoring the presence of an endometrial specific protein in a sample (potentially representing metastases) that comprises contacting
                                                                                         3ndometrial specific protein identified as DEX0379_11_aa_15 (SeqID 157).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid, useful for preparing a composition for diagnosing or treating endometrial cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents an alternatively spliced snake venom protease-1 (SVPH-1) polypeptide, designated SVPH-1c. The SVPH polypeptides are metalloproteinase-disintegrin protein family members. The SVPH polynucleotides can be used as probes to identify nucleic acids encoding proteins having metalloproteinase-disintegrin activity, to identify human chromosome 1 or 4, to map genes on those chromosomes, to identify genes associated with diseases, syndromes and conditions associated with the chromosomes, and to study proteinases and their activities on cell/cell interactions and the immune system. Sense or attisense oligonucleotides of SVPH can be used to inhibit gene expression of SVPH 1, 3, or 4. The SVPH polypeptides can be used to study cell/cell and cell/matrix interactions involved in cellular processes and in the immune system. The polypeptides may also be used to screen for inhibitors antibodies can be used in therapeutics. The antibodies can be used in assays to detect the presence of the polypeptides in vitro or in vivo, and to purify the polypeptides by affinity chromatography

                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a method for identifying a nucleotide or polypeptide sequence that may be a drug target, or essential for growth or viability of an organism. Polymucleotide sequences AAH51947 - AAH52092 represent DNA encoding proteins AAG81096 - AAG81241, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The method involves providing an unknown nucleotide or polypeptide sequences, and comparing it to a number of sequences along with at least one algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of an organism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ----EASFSDIVSGF---- 119
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying nuclectide or polypeptide sequence for use as drug target, involves providing algorithm that analyzes a functional relationship between nucleotide or polypeptide sequences, and comparing the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          82

```
This polypeptide comprises human TPC2, a protein that regulates telomere
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          length or modulates relomerase activity. Its amino acid sequence was deduced from a CDNA clone (see AAV19479) obtained from a human 293 cell library. TPC2 and TPC3 (see AAV194865) proteins can be obtained by purification from natural sources, by in vitro synthesis or by purification from recombinant host cells. They have application in methods for reconstituting in vitro telomerase or other enzymatic activities that maintain relomeres and regulate telomere length. These
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      activity in mammalian cells. Immunogenic peptides and proteins of the invention can also be used in therapeutic immunisation and vaccination procedures. Antibodies that specifically bind to TPC2 or TPC3 proteins can be used in screening, diagnosing and monitoring diseases and other conditions, such as cancer, pregancy or fertility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        methods have application in screens for therapeutic agents, and for diagnostic tests. In addition, peptides corresponding to TPC2 or TPC3 proteins can also be used to regulate telomere length and telomerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human TPC2, TPC3 and TR genes - regulate telomere length or modulate
                                                                                          the third C being uncertain"
                                                                                                                                                        the first G being uncertain"

The invention provides methods and reagents for regulating telomere length and modulating telomerase activity in mammalian cells as well as for detecting, diagnosing, and treating related diseases and conditions such as cancer, pregnancy, or fertility in humans and other mammals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence is the human TPC2 protein, which is contained within the

Patent No. 6607709

GRANFAL INFORMATION:
APPLICANT: GARY BRETON
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PROTEUS MIRABIL
TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 2709.1002-001
CURRENT APPLICATION NUMBER: US/09/543,681A
CURRENT FILING DATE: 2000-04-05
PRIOR APPLICATION NUMBER: US 60/128,706
PRIOR FILING DATE: 1999-04-09
NUMBER OF SEQ ID NOS: 8344
SEQ ID NOS: 8344

GENERAL INCORPATION:
APPLICANT: Lynn Doucette-Stamm et al
APPLICANT: Lynn Doucette-Stamm et al
TITLE OF INVENTION: WUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS
TITLE OF INVENTION: EPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC-007
CURRENT APPLICATION NUMBER: 18/09/134,001C
CURRENT PILING DATE: 1998-08-13
PRIOR APPLICATION NUMBER: US 60/064,964
PRIOR FILING DATE: 1997-11-08
PRIOR APPLICATION NUMBER: US 60/055,779
PRIOR APPLICATION NUMBER: US 60/055,779
NUMBER: OF SEQ ID NOS: 5674
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 8138, Application US/09543681A

Patent No. 6605709

GENERAL INFORMATION:

APPLICANT: GRAY BRETON

TITLE OF INVENTION: UNCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PROTEUS MIRABII

TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION UNMER: US 609543,681A

CURRENT FILING DATE: 2000-04-05

PRIOR FILING DATE: 1999-04-09

NUMBER OF SEQ ID NOS: 8344

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
